Architecture and Engineering Oleg Kapliński 2020-12-18 The book is addressed to architects and civil engineers. Design and research are areas connecting their activities. The contents of the book confirm the fact that the interface between architecture and engineering is multidimensional. The ways of finding points of contact between the two industries are highlighted. This is favored by the dynamically changing reality, supported by new design paradigms and new research techniques. The multithreaded subject matter of the articles is reduced to six sections: Research Scopes, Methods, Design Aspects, Context, Nature of Research, and Economy and Cost Calculation. Each of the articles in these six blocks has its weight. And so, in the Nature of Research section, the following areas have been underscored: laboratory tests, in situ research, field investigations, and street perception experiments. The section Design Aspects includes design-oriented thinking, geometrical forms, location of buildings, cost prediction, attractor and distractor elements, and shaping spatial structures. The new design and research tools are an inspiration and a keystone bonding architects and engineers.

Building the Skyline Jason M. Barr 2016-05-12 The Manhattan skyline is one of the great wonders of the modern world. But how and why did it form? Much has been written about the city's architecture and its general history, but little work has explored the economic forces that created the skyline. In *Building the Skyline*, Jason Barr chronicles the economic history of the Manhattan skyline. In the process, he debunks some widely held misconceptions about the city's history. Starting with Manhattan's natural and geological history, Barr moves on to how these formations influenced early land use and the development of neighborhoods, including the dense tenement neighborhoods of Five Points and the Lower East Side, and how these early decisions eventually impacted the location of skyscrapers built during the Skyscraper Revolution at the end of the 19th century. Barr then explores the economic history of skyscrapers and the skyline, investigating the reasons for their heights, frequencies, locations, and shapes. He discusses why skyscrapers emerged downtown and why they appeared three miles to the north in midtown-but not in between the two areas. Contrary to popular belief, this was not due to the depths of Manhattan's bedrock, nor the presence of Grand Central Station. Rather, midtown's emergence was a response to the economic and demographic forces that were taking place north of 14th Street after the Civil War. *Building the Skyline* also presents the first rigorous investigation of the causes of the building boom during the Roaring Twenties. Contrary to conventional wisdom, the boom was largely a rational response to the economic growth of the nation and city. The last chapter investigates the value of Manhattan Island and the relationship between skyscrapers and land prices. Finally, an

Epilogue offers policy recommendations for a resilient and robust future skyline.

This text combines technical compliance with practical solutions in relation to cost planning, estimating, time, and cost control. It incorporates solutions that are technically sound as well as cost effective and time efficient. It focuses on the integration of design and construction based on solid engineering foundations contained within a code of ethics, and navigates engineers through the complete process of project design, pricing, and tendering. Well illustrated The book uses cases studies to illustrate principles and processes. Although they center on Australasia and Southeast Asia, the principles are internationally relevant. The material details procedures that emphasize the correct quantification and planning of works, resulting in reliable cost and time predictions. It also works toward minimizing the risk of losing business through cost blowouts or losing profits through underestimation. This Text Details the Quest for Practical Solutions That: Are cost effective Can be completed within a reasonable timeline Conform to relevant quality controls Are framed within appropriate contract documents Satisfy ethical professional procedures, and Address the client's brief through a structured approach to integrated design and cost management Designed to help civil engineers develop and apply a multitude of skill bases, *Integrated Design and Cost Management for Civil Engineers* can aid them in maintaining relevancy in appropriate design justifications, guide work tasks, control costs, and structure project timelines. Bulls Markets Sean Dinces 2022-07-20 An unvarnished look at the economic and political choices that reshaped contemporary Chicago—arguably for the worse. The 1990s were a glorious time for the Chicago Bulls, an age of historic championships and all-time basketball greats like Scottie Pippen and Michael Jordan. It seemed only fitting that city, county, and state officials would assist the team owners in constructing a sparkling new venue to house this incredible team that was identified worldwide with Chicago. That arena, the United Center, is the focus of *Bulls Markets*, an unvarnished look at the economic and political choices that forever reshaped one of America's largest cities—arguably for the worse. Sean Dinces shows how the construction of the United Center reveals the fundamental problems with neoliberal urban development. The pitch for building the arena was fueled by promises of private funding and equitable revitalization in a long-blighted neighborhood. However, the effort was funded in large part by municipal tax breaks that few ordinary Chicagoans knew about, and that wound up exacerbating the rising problems of gentrification and wealth stratification. In this portrait of the construction of the United Center and the urban life that developed around it, Dinces starkly depicts a pattern of inequity that has become emblematic of contemporary American cities: governments and sports franchises collude to provide amenities for the wealthy at the expense of poorer citizens, diminishing their experiences as fans and—far worse—creating an urban environment that is regulated and surveilled for the comfort and protection of that same moneyed elite.

Introduction to Civil Engineering Systems Samuel Labi 2014-03-25 This book presents an integrated systems approach to the evaluation, analysis, design, and maintenance of civil engineering systems. Addressing recent concerns about the world's aging civil infrastructure and its environmental impact, the author makes the case for why any civil infrastructure should be seen as part of a larger whole. He walks readers through all phases of a civil project, from feasibility assessment to construction to operations, explaining how to evaluate tasks and challenges at each phase using a holistic approach. Unique coverage of ethics, legal issues, and management is also included.

Life-Cycle Cost Models for Green Buildings I.M. Chethana S. Illankoon 2020-10-29 *Life-Cycle Cost Models for Green Buildings: With Optimal Green Star Credits* illustrates the tools and methods for developing a life-cycle cost model that incorporates developer constraints while maximizing the number of credit points achieved. The book identifies the interdependencies among various credits in the Green Star environmental rating system. Afterwards, life-cycle cost is calculated by considering six main central business districts (CBDs) of Australia. The net present value (NPV) technique is used to calculate life-cycle costs. Further, a sensitivity analysis is also carried out for selected credits to identify the changes to life-cycle cost to the changes in discount rate. Once all the life-cycle cost data is calculated, this book illustrates the development of the proposed model using a Java application which allows users to evaluate each key criterion of green buildings separately. The book is designed to provide ample knowledge of the various options available to get green building certification and the further implications in-terms of life-cycle. Provides cost saving and management advice for keeping a green building project operating on time and budget throughout their life-cycle Expertly explains the various options available for gaining green

building certification Allows users to build life-cycle cost models which is unique to the project at hand

Multi-hazard Approaches to Civil Infrastructure Engineering Paolo Gardoni 2016-06-22 This collection focuses on the development of novel approaches to address one of the most pressing challenges of civil engineering, namely the mitigation of natural hazards. Numerous engineering books to date have focused on, and illustrate considerable progress toward, mitigation of individual hazards (earthquakes, wind, and so forth.). The current volume addresses concerns related to overall safety, sustainability and resilience of the built environment when subject to multiple hazards: natural disaster events that are concurrent and either correlated (e.g., wind and surge); uncorrelated (e.g., earthquake and flood); cascading (e.g., fire following earthquake); or uncorrelated and occurring at different times (e.g., wind and earthquake). The authors examine a range of specific topics including methodologies for vulnerability assessment of structures, new techniques to reduce the system demands through control systems; instrumentation, monitoring and condition assessment of structures and foundations; new techniques for repairing structures that have suffered damage during past events, or for structures that have been found in need of strengthening; development of new design provisions that consider multiple hazards, as well as questions from law and the humanities relevant to the management of natural and human-made hazards.

Decision Support for Construction Cost Control in Developing Countries Pettang, Chrispin 2016-03-08 The continued growth of emerging nations depends largely on the development of their built infrastructures and communities. Roads, dams, bridges, hospitals, schools, and housing are all examples of the built environment that impacts economic improvements in the developing world. Decision Support for Construction Cost Control in Developing Countries explores how the construction industry contributes to a nation's GDP and the related cost issues and proposed cost reduction solutions for construction projects and initiatives in developing regions. Emphasizing the role of decision support systems for reducing and managing the costs associated with construction projects, this title is an essential reference source for civil engineers, business and engineering managers, project managers, researchers, and professionals in the construction industry.

Milestones in European Housing Finance Jens Lunde 2016-01-08 This book provides evidence on how housing finance markets developed across Europe. The objective of the text is to bring together up to date material from across Europe which will help to clarify (i) how national housing finance markets have dealt with the challenges of deregulation and privatisation since the 1980s,(ii) how the financial crisis has impacted on the structure of the industry and the range of financial instruments available, (iii) how governments and the EU have responded to increasing risks and higher indebtedness in most West European countries and the need to grow new finance markets in Eastern Europe, and (iv) how changing housing finance markets impact on the capacity to provide adequate affordable housing into the future.

Domestic Microgeneration Iain Staffell 2015-06-19 Microgeneration – producing energy for the home, in the home – is a substantial improvement over the current centralised and detached energy model employed the world over. Domestic Microgeneration is the first in-depth reference work for this exciting and emerging field of energy generation. It provides detailed reviews of ten state-of-the-art technologies: including solar PV and thermal, micro-CHP and heat pumps; and considers them within the wider context of the home in which they are installed and the way that they are operated. Alongside the many successes, this book highlights the common pitfalls that beset the industry. It offers best-practice guidance on how they can be avoided by considering the complex linkages between technology, user, installer and government. This interdisciplinary work draws together the social, economic, political and environmental aspects of this very diverse energy 'genre' into a single must-have reference for academics and students of sustainability and energy related subjects, industry professionals, policy makers and the growing number of energy-literate householders who are looking for ways to minimise their environmental footprint and their energy bills with microgeneration.

Measuring Construction Rick Best 2015-04-17 Despite the size, complexity and importance of the construction industry, there has been little study to date which focuses on the challenge of drawing reliable conclusions from the available data. The accuracy of industry reports has an impact on government policy, the direction and outcomes of research and the practices of construction firms, so confusion in this area can have far reaching consequences. In response to this, Measuring Construction looks at fundamental economic theories and concepts with respect to the construction industry, and explains their merits and shortcomings, sometimes by looking at real life examples. Drawing on current research the contributors tackle: industry performance productivity measurement construction in national accounts comparing international construction costs and prices comparing international productivity The scope of the book is international, using data and publications from four continents, and tackling head on the difficulties arising from measuring construction. By addressing

problems that arise everywhere from individual project documentation, right up to national industrial accounts, this much-needed book can have an impact at every level of the industry. It is essential reading for postgraduate construction students and researchers, students of industrial economics, construction economists and policy-makers.

Building Information Modeling Karen M. Kensek 2014-04-16 This is a design guide for architects, engineers, and contractors concerning the principles and specific applications of building information modeling (BIM). BIM has the potential to revolutionize the building industry, and yet not all architects and construction professionals fully understand what the benefits of BIM are or even the fundamental concepts behind it. As part of the PocketArchitecture Series it includes two parts: fundamentals and applications, which provide a comprehensive overview of all the necessary and essential issues. It also includes case studies from a range of project sizes that illustrate the key concepts clearly and use a wide range of visual aids. Building Information Modeling addresses the key role that BIM is playing in shaping the software tools and office processes in the architecture, engineering, and construction professions. Primarily aimed at professionals, it is also useful for faculty who wish to incorporate this information into their courses on digital design, BIM, and professional practice. As a compact summary of key ideas it is ideal for anyone implementing BIM.

China's Urban Construction Land Development Tao Liu 2019-10-16 This book examines the nature and internal dynamics of China's urban construction land (UCL) development, drawing insights from the recently developed theory of regional political ecology. Based on the author's original research, it identifies two different types of UCL development in China, namely top-down, formal development in the legal and regulated domain, and spontaneous and informal, bottom-up development in the semi-legal, poorly regulated gray domain. Presenting a systematic analysis and comparison, it reveals a scale and speed of informal land development no less significant than that of formal land development, although informal land development tends to be scattered, pervasive, difficult to track, and largely overlooked in research and policy formation. Contrary to the popular perception of the peasantry as passive victims of land development, this book uncovers an intriguing dynamic in which the peasantry has played an increasingly (pro)active role in developing their rural land for urban uses in informal markets. Further, based on an investigation of UCL development in Beijing and Shenzhen, it shows an interesting trajectory in which the uneven growth and utilization of UCL are contingent upon the various developmental milieus in different places. China's land institutions, based on an urban-rural dual land system, are not conducive to the ultimate goal of saving and efficiently utilizing land. Accordingly, an urban-rural integrated land market and management system is highly advisable. The theoretical and empirical enquiry presented challenges the perceived notion of China's UCL development as the outcome of market demand and state supply. Further, it argues for an inclusive treatment of the informality that has characterized urbanization in many developing countries, and for a reassessment of the role played by the peasantry in land-based urbanization.

Building Cost Planning for the Design Team Jim Smith 2016-02-26 Cost management of all building projects has become increasingly important as clients in the public and private sector demand the highest quality cost planning services with accurate budgeting and cost control. All members of the design team must integrate their activities to ensure that a high quality project is delivered on time and within budget. This book considers building cost planning and cost control from the client and the design team's perspective, where all decisions whether concerned with design, cost, quality, time, value or sustainability are taken as being interrelated. The latest Royal Institute of British Architects (RIBA) Plan of Work and the New Rules of Measurement for Early Stage Estimating and Cost Planning issued by the Royal Institution of Chartered Surveyors (RICS) have been incorporated into this new text. The book follows the building design cost planning process from the crucial inception stages and then through all the design stages to the completion of the technical design, contract documentation and the tender. It provides a template for good cost planning practice. An essential addition to this third edition is the introduction of integrated design and documentation processes captured in building Information modelling (BIM), on-line cost databases and computerised methods of cost planning. The integrated approaches are explained and provide vital information and knowledge for practitioners involved in building projects. All stakeholders involved in development and design and client teams in public and private sector policy making and implementation need to understand the new approaches to design management processes and how cost planning and design approaches are adapting to using the new technology in practice. The interactive style, using in-text and review questions makes this ideal for students and practitioners alike in property, architecture, construction economics, construction management, real estate, engineering, facilities management and project management.

Construction Cost Management Keith Potts 2014-01-23 In this updated and expanded second edition, Keith Potts and Nii Ankrah examine key issues in construction cost management across the building and civil engineering sectors, both in the UK and overseas. Best practice from pre-contract to post-contract phases of the project life-cycle are illustrated using major projects such as Heathrow Terminal 5, Crossrail and the London 2012 Olympics as case studies. More worked examples, legal cases, case studies and current research have been introduced to cover every aspect of the cost manager's role. Whole-life costing, value management, and risk management are also addressed, and self-test questions at the end of each chapter

support independent learning. This comprehensive book is essential reading for students on surveying and construction management programmes, as well as built environment practitioners with cost or project management responsibilities.
