School Policies and Practices Affecting Instruction in Mathematics Hawkins 1998 The teaching and learning of mathematics continues to generate tremendous attention, both among those who support recent innovations and, more recently, among those who question the wisdom of the promulgated reforms. In order to bring an empirical basis to this debate, it is important to gather information on the policies and practices that are actually implemented. This report provides one source for such information and is the second in a series that discusses results from the National Assessment of Educational Progress (NAEP) description of the educational policies and practices that prevailed during this period of sustained increase in mathematics achievement, giving particular attention to the relationship between these policies, practices, and student performance on the NAEP mathematics assessment. Information on the status of mathematics education in 1996 is provided, and changes that took place from the time of earlier NAEP assessments is also chronicled. (ASK)

On Evaluating Curricular Effectiveness National Research Council 2004-11-12 This book reviews the evaluation research literature that has accumulated around 19 K-12 mathematics curricula and breaks ground in framing an ambitious and rigorous approach to curriculum evaluation that has relevance beyond mathematics. The committee that produced this book consisted of mathematicians, mathematics educators, and methodologists who began with the following charge: Evaluate the quality of the evaluation of the thirteen National Science Foundation (NSF)-supported and six commercially generated mathematics curriculum materials; Determine whether the available data are sufficient for evaluating the efficacy of these materials, and if not; Develop recommendations about the design of a project that could result in the generation of more reliable and valid data for evaluating such materials. The committee collected, reviewed, and classified almost 700 studies, solicited expert testimony during two workshops, developed an evaluation framework, established dimensions/criteria for three methodologies (content analyses, comparative studies, and case studies), drew conclusions on the corpus of studies, and made recommendations for future research.

Lessons Learned Tom Loveless 2008-08-01 Standards for education achievement are under scrutiny throughout the industrial world. In this technological age, student performance in mathematics is seen as being particularly important. For more than four decades, international assessments conducted by the International Association for Evaluation of Educational Achievement (IEA) have measured how well students are learning mathematics in different countries. The latest round of mathematics testing of Trends in Mathematics and Science Study (TIMSS) takes place in 2007. Beyond the horse race—the rankings that compare nations—what have we learned from the wealth of data collected in these assessments? How do US math curriculums compare to those used overseas? Is the effect of technology on the classroom uniform across nations? How do popular math reforms fare abroad? Those are some of the critical issues tackled in this important book. The authors use the database to address several pressing questions about school policy and educational research. For example, Ina Mullis and Michael Martin review the major lessons learned over the history of TIMSS testing. William Schmidt and Richard T. Houang examine whether curricular breadth affects student achievement. Jeremy Kilpatrick, Vilma Mesa-Lago, and Finbarr Sloane evaluate American performance in algebra relative to other nations and pinpoint

strengths and weaknesses in American students' learning of algebra.
