One Plus One Equals One John Archibald 2014-06-26 We are in the midst of a revolution. It is a scientific revolution built upon the tools of molecular biology, with which we probe and prod the living world in ways unimaginable a few decades ago. Need to track a bacterium at the root of a hospital outbreak? No problem: the offending germ's complete genetic profile can be obtained in 24 hours. We insert human DNA into *E. coli* bacteria to produce our insulin. It is natural to look at biotechnology in the 21st century with a mix of wonder and fear. But biotechnology is not as 'unnatural' as one might think. All living organisms use the same molecular processes to replicate their genetic material and the same basic code to 'read' their genes. The similarities can be seen in their DNA. Here, John Archibald shows how evolution has been 'plugging-and-playing' with the subcellular components of life from the very beginning and continues to do so today. For evidence, we need look no further than the inner workings of our own cells. Molecular biology has allowed us to gaze back more than three billion years, revealing the microbial mergers and acquisitions that underpin the development of complex life. *One Plus One Equals One* tells the story of how we have come to this realization and its implications.

Empirical Model Building James R. Thompson 2011-11-30 Praise for the First Edition "This... novel and highly stimulating book, which emphasizes solving real problems... should be widely read. It will have a positive and lasting effect on the teaching of modeling and statistics in general." - Short Book Reviews This new edition features developments and real-world examples that showcase essential empirical modeling techniques. Successful empirical model building is founded on the relationship between data and approximate representations of these systems that generated that data. As a result, it is essential for researchers who construct these models to possess the special skills and techniques for producing results that are insightful, reliable, and useful. *Empirical Model Building: Data, Models, and Reality, Second Edition* presents a hands-on approach to the basic principles of empirical model building through a shrewd mixture of differential equations, computer-intensive methods, and data. The book outlines both classical and new approaches and incorporates numerous real-world statistical problems that illustrate modeling approaches that are applicable to a broad range of audiences, including applied statisticians and practicing engineers and scientists. The book continues to review models of growth and decay, systems where competition and interaction add to the complexity of the model while discussing both classical and non-classical data analysis methods. This Second Edition now features further coverage of momentum based investing practices and resampling techniques, showcasing their importance and expediency in the real world. The author provides applications of empirical modeling, such as computer modeling of the AIDS epidemic to explain why North America has most of the AIDS cases in the First World and data-based strategies that allow individual investors to build their own investment portfolios. Throughout the book, computer-based analysis is emphasized and newly added and updated exercises allow readers to test their comprehension of the presented material. *Empirical Model Building, Second Edition* is a suitable book for modeling courses at the upper-graduate and graduate levels. It is also an excellent reference for applied statisticians and researchers who carry out quantitative modeling in their everyday work.

Physics and Speculative Philosophy Timothy E. Eastman 2016-02-22 Through both an historical and philosophical analysis of the concept of possibility, we show how including both potentiality and actuality as part of the real is both compatible with experience and contributes to solving key problems of fundamental process and emergence. The book is organized into four main sections that incorporate our routes to potentiality: (1) potentiality in modern science (history and philosophy; quantum physics and complexity); (2) Relational Realism [ontological interpretation of quantum physics; philosophy and logic]; (3) Process Physics [ontological interpretation of relativity theory; physics and philosophy]; (4) on speculative philosophy and physics [limitations and approximations; process philosophy]. We conclude that certain fundamental problems in modern physics require complementary analyses of certain philosophical and metaphysical issues, and that such scholarship reveals intrinsic features and limits of determinism, potentiality and emergence that enable, among others, important progress on the quantum theory of measurement problem and new understandings of emergence.

Springer Handbook of Spacetime Abhay Ashtekar 2014-09-01 The *Springer Handbook of Spacetime* is dedicated to the ground-breaking paradigm shift embodied in the two relativity theories, and describes in detail the profound reshaping of physical sciences they ushered in. It includes in a single volume chapters on foundations, on the underlying mathematics, on physical and astrophysical implications, experimental evidence and cosmological predictions, as well as chapters on efforts to unify general relativity and quantum physics. The *Handbook* can be used as a desk reference by researchers in a wide variety of fields, not only by specialists in relativity but also by researchers in related areas that either grew out of, or are deeply influenced by, the two relativity theories: cosmology, astronomy and astrophysics, high energy physics, quantum field theory, mathematics, and philosophy of science. It should also serve as a valuable resource for graduate students and young researchers entering these areas, and for instructors who teach courses on these subjects. The *Handbook* is divided into six parts. Part A: Introduction to Spacetime Structure. Part B: Foundational Issues. Part C: Spacetime Structure and Mathematics. Part D: Confronting Relativity theories with observations. Part E: General relativity and the universe. Part F: Spacetime beyond Einstein.

Nuclear Physics (1929-1952) R. Peierls 2013-10-22 "Nuclear Physics" deals with Bohr's work on nuclear physics which began in the pre-1932 days with his thinking deeply, but inconclusively about the seeming contradictions then presented by the evidence about the nucleus. In 1936, Bohr recognised and described the insights provided by neutron scattering experiments; the excitement of this new understanding and its extension and consolidation occupied much of the subsequent years. In 1939, he was again first in understanding the essential features of the newly discovered phenomenon of fission, applying successfully the point of view of nuclear reactions which he had developed over the past three years. Later, in 1949-50, he was impressed by the success of the nuclear shell model, which on the face of it seemed hard to reconcile with the picture of the closely interacting nucleons which he had pioneered in 1936. Bohr put much effort into clarifying this paradox. *Physics, Uspekhi* 1999

The Most Wanted Man in China Fang Lichi 2016-02-09 The long-awaited memoir by Fang Lichi, the celebrated physicist whose clashes with the Chinese regime helped inspire the Tiananmen Square protests Fang Lichi was one of the most prominent scientists of the People's Republic of China; he worked on the country's first nuclear program and later became one of the world's leading astrophysicists. His devotion to science and the pursuit of truth led him to question the authority of the Communist regime. That got him in trouble. In 1957, after advocating reforms in the Communist Party, Fang – just twenty-one years old – was dismissed from his position, stripped of his Party membership, and sent to be a farm laborer in a remote village. Over the next two decades, through the years of the Great Leap Forward and the Cultural Revolution, he was alternately denounced and rehabilitated, revealing to him the pettiness, absurdity, and horror of the regime's excesses. He returned to more normal work in academia after the death of Mao Zedong in 1976, but the cycle soon began again. This time his struggle became a public cause, and his example helped inspire the Tiananmen Square protests. Immediately after the crackdown in June 1989, Fang and his wife sought refuge in the U.S. embassy, where they hid for more than a year before being allowed to leave the country. During that time Fang wrote this memoir *The Most Wanted Man in China*, which has never been published, until now. His story, told with vivid detail and disarming humor, is a testament to the importance of remaining true to one's principles in an unprincipled time and place.

Time & Matter I. I. Bigi 2006 Time and matter are the most fundamental concepts in physics and in any science-based description of the world around us. Quantum theory has, however, revealed many novel insights into these concepts in non-relativistic, relativistic and cosmological contexts. The implications of these novel perspectives have been realized and, in particular, probed experimentally only recently. In the papers in this proceedings, these issues are discussed in a truly interdisciplinary fashion from philosophical and historical perspectives. The leading contributors, including Nobel laureates T W H'nsch and G 't Hoof, address both experimental and theoretical issues.

Progress in Physics, vol.2/2005 Dmitri Rabounski Progress in Physics has been created for publications on advanced studies in theoretical and experimental physics, including related themes from mathematics.

The World as Active Power 2009-09-30 This collection of essays discusses a central feature of European philosophy: the idea of a universal active power as the ultimate world-explanation. The development of this idea is traced from Plato onwards, as it traverses through Stoicism, Neoplatonism, medieval scholasticism, and modern rationalism to Hegel and Schopenhauer.
